AUTHOR: Mazo, Ye.B.

TITLE: On the Question of Prophylaxis of Suppuration of the Wound of the Abdominal Wall After Appendectomy (K voprosu o profilaktike nagnoyeni rany bryushnoy stenki posle appendektomii)

PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 4, pp 33-37 (USSR)

ABSTRACT: The article deals with the prophylaxis of post-operative suppuration of the wound of the abdominal wall after appendectomy. M.V. Krasnosel'skiy counted about 56.8%, and S.G. Toprover about 50.4% suppurations in all appendectomies. Two methods for preventing post-operative suppuration of the abdominal wall are now in use: a) the dry suture with an administration of antibiotics, and b) provisional sutures in combination with antibiotics and without them. Based on data obtained at the Klinicheskaya bol'nitsa (Clinical Hospital) in

Card 1/2

SCV/177 -58-4-10/32

On the Question of Prophylaxis of Suppuration of the Wound of the Abdominal Wall After Appendectomy

Moscow, the author concludes that the application of provisional sutures of the skin with the panniculus adiposus is the most effective method for reducing post-operative suppuration in destructive forms of acute appendicitis. The best results were observed by drawing together the skin wound after 2 to 4 days of the post-operative period. The younger the patients, the better were the results in applying provisional sutures. The worst results were obtained in gangrenous and perforated appendicitis. There are various methods of administering antibiotics in combination with provisional sutures which do not noticeably improve the healing process of the wound. There are 4 tables.

TITLE: Effect of aluminum oxide on the properties of glasses of certain alkali-free systems

SOURCE: Vsesoyuznoye soveshchaniye po stekloobraznomu sostoyaniyu. 4th, Leningrad, 1964. Stekloobraznoye sostoyaniye (Vitreous state); trudy soveshchaniya. Leningrad, Izd-vo Nauka, 1965, 144-146

TOPIC TAGS: glass property, silicate glass, alumina, coordination chemistry

ABSTRACT: A study of the properties of glasses in the systems $\text{CaO-SrO-Al}_2\text{O}_3\text{-SiO}_2$ and $\text{MnO-CaO-SrO-Al}_2\text{O}_3\text{-SiO}_2$ showed that the composition-property curves have an inflection point at a certain content of Al_2O_3 . Glass of composition corresponding to this inflection point has many valuable properties (water resistance, high elastic modulus E , fast crystal growth rate). Anomalous effects of Al_2O_3 on glass properties were also observed in the systems $\text{MgO-Al}_2\text{O}_3\text{-SiO}_2$ and $\text{SrO-Al}_2\text{O}_3\text{-SiO}_2$. The role of Al_2O_3 is a dual one, since it improves the properties up to a certain content, then lowers them. This behavior is attributed to a change in the coordination of Al^{3+} in alkali-free vitreous systems as their basicity increases, and the corresponding structural interpretation is given to account for changes in crystallizing tendency, chemical stability, and elastic modulus. Analysis of changes in

✓ Active alloys for the direct synthesis of methylchlorosilanes. Jaroslav Žitka, Jiří Čermák, and Václav Mazoch. Czech. 87,636; Sept. 15, 1957. The process of allowing alloys of Si, Cu, and Al to temper in an oven for 6-12 hrs. above the eutectic temp. (800-1100°) and 6-10 hrs. at a sub-eutectic temp. (600-800°) gives products that bring about a higher conversion of Si (80-90%), a greater yield of higher methylated chlorosilanes, and a better reproducibility of the process. Fuse in a C crucible 42.75 kg. Si (99% Si) for 3 hrs. and 20 min. at 1470° in a gas-heated oven, add 7 kg. cathode Cu in blocks and, after the Cu has melted (approx. 15 min.), add 0.25 kg. Al in shreds. Mix the contents with a rod. After 2 min. transfer the molten mass to another prewarmed C crucible, keep for 6 hrs. at 870° and for another 6 hrs. at 700°, and then allow to cool gradually for 6-10 hrs. In another example the Si:Cu ratio is 85.5:14 and the alloy is tempered for 10 hrs. at 1000° and then allowed to cool slowly for 12 hrs. L. J. Urbánek

TITLE: The Green Road to the Black Treasure (Zelenaya ulitsa -
k chernomu kladu)
Hard Working Days are Similar to Fighting (Dni raboty
zharkiye, na boi polhozhiye)

PERIODICAL: Tekhnika Molodezhi, 1958, V. 26, Nr 3, pp. 1-4 (USSR).

ABSTRACT: This is a report on the construction of 37 instead of the 35
planned mine shafts in the Donetz-basin built by the Komsomoltses
in the course of 365 working-days. Together with the secretary for
Stalin's District Committee of the Komsomol Boris Ivanovich Zuckov
and the Deputy Chief Engineer of the Institute "Stalinskiy proshakht-
stroy" Ivan Mikhailovich Marchenko from the town Stalino the author
went to the new settlement imeni Kirov, which was built by youth
brigades. The shafts Nikolayevskaya, Donetskaya-tret'ya, Drogobychs=
kaya and others recently set in operation, are not far from there.
Marchenko pointed to the large shaft imeni Lenin and said that the
building of such extremely large shafts makes the proper output of
coal possible only after years. Yet the country urgently requires

Card 1/3

The Green Road to the Black Treasure
Hard Working Days are Similar to Fighting

29-3-1/25

coal right now. A way out of the difficulty was found. In the Donbass, which has been exploited since long already, there is still a great deal of coal layers embedded in 100 to 200 m of depth. They are often off the main deposits and the building of great shafts would not be profitable since their deposits would be exhausted after 10 to 20 years already. Therefore it would be more profitable to construct small shafts exploitable for a period of 10 to 20 years. The party made an appeal and 25000 young enthusiasts volunteered for this work. But, since most of them came from other professions and since enthusiasm alone would not have been sufficient for carrying out this gigantic enterprise, approved shaft-builders were attached to the volunteers as experienced instructors. Ivan Vasil'yevich Pilipenko - Hero of Socialist Labor, built the shaft "Volynskaya Komsomol'skaya" together with the young volunteers. The shaft of 250 m depth was accomplished not within 6 months, but within 3 months only. The brigade of Ivan Rupinets did not stay behind. The young sinkers of the brigade Ivan Zakabluk hewed 107 standard meters in June, instead of 40. Records were beaten this way. Many famous sinkers, construction workers and fitters imparted their knowledge to the young people: The Heroes of Socialist Labor, Nikolai

Card 2/3

The Green Road to the Black Treasure
Hard Working Days are Similar to Fighting

29-3-1/25

Tikhonov and Nikolai Bankov, one of the oldest sinkers Aleksandr Ivanovich Mezhegurskiy, Vasiliy Martynyuk, Ivan Solonin, the Brigadiers Savin, Malusha and dozens of others. One learned from the other. The experience of the one was applied by the other and in this way the work could be improved and facilitated. B. I. Zubkov said that due to the judgment and adaptability of the youth, it was possible to utilize technization to its full extent.

Numbers and facts: The planned capacity of the new shafts which were built as quick as possible amounts from 100 to 500 thousand tons of coal per shaft and year. The 37 shafts built by the Komsomoltses shall furnish 6 million tons of coal in 1958. This is almost as much as produced in the whole of Russia at the end of the last century. Well equipped settlements with shops, dining-rooms, kindergartens and nurseries developed in the vicinity of the shafts. The total dwelling-surface approximately amounts to 160 thousand m². Half the young builders remained there to continue work in the shafts. There are 4 figures.

Problems in the Composite Mechanization of Welding

prepare a bulletin-catalog of auxiliary welding equipment. In discussions, delegates spoke of mechanization of welding at Uralkhimmashzavod (Ye.I. Starchenko); Nikolayevskiy Sudostroitel'nyy zavod im. Nosenko (Nikolayev Shipbuilding Works imeni Nosenko), (S.N. Berezhnitskiy); "Rostsel'mash" (Vasil'chenko). Head Specialist of GNTK SSSR F.V. Arifmetchikov dwelt on application of welded designs in machine industry and the development of welding during the Seven Year Plan. Ye.V. Vasil'yev (NII-Traktorsel'khoz mash) described the work of his institute on new welding equipment for the production of farming machines. In the introductory part of the article it is mentioned that a mass welding mechanization campaign has started. The lines are as follows and apply to the plants mentioned below: a highly mechanized line welding RR tank cars at Zhdanovskiy

Card 5/6

X

69309

S/118/60/000/02/017/024
D038/D006

Problems in the Composite Mechanization of Welding

zavod tyazhelogo mashinostroyeniya (Zhdanov Heavy Machine-Building Plant); two lines for welding automobile wheels and welded chains at the plants near Gor'kovskiy sovnarkhoz (Gorkiy Sovnarkhoz); Europe's largest welding lines for large-diameter straight-weld pipes at Chelyabinskiy truboprokatnyy zavod (Chelyabinsk Pipe-Rolling Plant); a welding line for mine cars at Toret'skiy zavod ugol'nogo mashinostroyeniya (Toret'skiy Coal Mining Machine Plant). It was noted that the mechanization level of auxiliary work in construction of welded structures is too low and that standardized design and centralized production must be developed for such equipment. It was deemed necessary to establish a main organization for designing, experimental work production organization and coordination of the design work of plants and institutes.

Titles : ~~Mass attraction of insects by ultra-violet radiation~~
 Mass attraction of insects by ultra-violet radiation
Periodical : Dok. AN SSSR 102/4, 729-732, Jun 1, 1955
Abstract : Experiments with mercury luminescent lamps are described. The experiments were conducted to establish the fact that ultra-violet light, radiated in larger amounts by a mercury lamp and then by an incandescent lamp of the same wattage, is visible to insects since they are attracted to the mercury lamps in large numbers. Ten references: 3 USSR, 3 German and 4 USA (1913-1954).

Title : Reflection Qualities of Butterfly Wings and the Role of Ultraviolet Rays in the Visual Perception of Insects

Orig Pub : Biofizika, 1957, 2, No 3, 358-368

Abstract : The photographing by ultraviolet rays (2365 mμ) of representatives of 12 families of Lepidoptera (over 50 species) determined their wings' ability to reflect these rays. The maximum reflection (40-70%) was recorded for the yellow and orange Gonomyza, Catopsilia, Dorcas, blue Lycaena and the white Nyctalia, Spilosoma, Hepialus. Some forms (Gonomyza, Aporia, Lycaena, and others) displayed a sharp sexual deformity in the intensity of the

Title : The Use of Ultraviolet Radiation in the Control
of Pests on Pond Farms

Orig. Pub : Tr. sov. akademi. Ichtiol. Komit. AN SSSR, 1957,
No. 7 (a), 404-405

Abstract : Many insects were very sensitive to ultraviolet
rays. The eyes of insects are, apparently, more
sensitive to ultraviolet radiation than to the
rays of the spectrum seen by man. Insects feed-
ing on larvae and small fry of fish gather around
the source of ultraviolet radiation in mass: diving
beetles (Acroderes, Cypselus, Acilius, Colymbetes),
water scavenger beetles (Notonecta) and

corixes (Corixa). These insects habitually found in every pond and lake can destroy a lot of fish. One larva of the small diving beetle *A. sulcatus* consumed 131 small fish in 12 days, and one *Notonecta* consumed 91 small fish in 9 days. More than 1000 beetles, mostly diving beetles, were attracted to a mercury-mercury lamp PRK-4 of 220 W. in one hour. The insects are attracted in a 500 m. radius in a flat locality without forests. The most intense flight was observed in clam warm weather in the south of the RSFSR at a temperature above 18-20°, in the central oblasts - at a temperature above 12°. The destroying part of the trap could be in the form of a funnel with a poisonous liquid at the bottom, for instance kerosene, or with arrangements for suction, while the section of the ground under the trap could
